

Let  $(E, \|\cdot\|)$  be a normed vector space. Recall from Section 9.7 that a sequence  $(u_k)$  of vectors  $u_k \in E$  converges to a limit  $u \in E$ , if for every  $\epsilon > 0$ , there some natural number  $N$  such that

$$\|u_k - u\| \leq \epsilon, \quad \text{for all } k \geq N.$$

We write

$$u = \lim_{k \rightarrow \infty} u_k.$$

If  $E$  is a finite-dimensional vector space and  $\dim(E) = n$ , we know from Theorem 9.5 that any two norms are equivalent, and if we choose the norm  $\|\cdot\|_\infty$ , we see that the convergence of the sequence of vectors  $u_k$  is equivalent to the convergence of the  $n$  sequences of scalars formed by the components of these vectors (over any basis). The same property applies to the finite-dimensional vector space  $M_{m,n}(K)$  of  $m \times n$  matrices (with  $K = \mathbb{R}$  or  $K = \mathbb{C}$ ), which means that the convergence of a sequence of matrices  $A_k = (a_{ij}^{(k)})$  is equivalent to the convergence of the  $m \times n$  sequences of scalars  $(a_{ij}^{(k)})$ , with  $i, j$  fixed ( $1 \leq i \leq m$ ,  $1 \leq j \leq n$ ).

The first theorem below gives a necessary and sufficient condition for the sequence  $(B^k)$  of powers of a matrix  $B$  to converge to the zero matrix. Recall that the spectral radius  $\rho(B)$  of a matrix  $B$  is the maximum of the moduli  $|\lambda_i|$  of the eigenvalues of  $B$ .

**Theorem 10.1.** *For any square matrix  $B$ , the following conditions are equivalent:*

- (1)  $\lim_{k \rightarrow \infty} B^k = 0$ ,
- (2)  $\lim_{k \rightarrow \infty} B^k v = 0$ , for all vectors  $v$ ,
- (3)  $\rho(B) < 1$ ,
- (4)  $\|B\| < 1$ , for some subordinate matrix norm  $\|\cdot\|$ .

*Proof.* Assume (1) and let  $\|\cdot\|$  be a vector norm on  $E$  and  $\|\cdot\|$  be the corresponding matrix norm. For every vector  $v \in E$ , because  $\|\cdot\|$  is a matrix norm, we have

$$\|B^k v\| \leq \|B^k\| \|v\|,$$

and since  $\lim_{k \rightarrow \infty} B^k = 0$  means that  $\lim_{k \rightarrow \infty} \|B^k\| = 0$ , we conclude that  $\lim_{k \rightarrow \infty} \|B^k v\| = 0$ , that is,  $\lim_{k \rightarrow \infty} B^k v = 0$ . This proves that (1) implies (2).

Assume (2). If we had  $\rho(B) \geq 1$ , then there would be some eigenvector  $u (\neq 0)$  and some eigenvalue  $\lambda$  such that

$$Bu = \lambda u, \quad |\lambda| = \rho(B) \geq 1,$$

but then the sequence  $(B^k u)$  would not converge to 0, because  $B^k u = \lambda^k u$  and  $|\lambda^k| = |\lambda|^k \geq 1$ . It follows that (2) implies (3).

Assume that (3) holds, that is,  $\rho(B) < 1$ . By Proposition 9.12, we can find  $\epsilon > 0$  small enough that  $\rho(B) + \epsilon < 1$ , and a subordinate matrix norm  $\|\cdot\|$  such that

$$\|B\| \leq \rho(B) + \epsilon,$$
