

For  $v = -u$ , we have  $\tau_{\varphi, u+v} = \varphi_{\varphi, 0} = \text{id}$ , so  $\tau_{\varphi, u}^{-1} = \tau_{\varphi, -u}$ , as claimed.

Therefore, we proved that every linear isomorphism of  $E$  that leaves every vector in some hyperplane  $H$  fixed and has the property that  $f(x) - x \in H$  for all  $x \in E$  is given by a map  $\tau_{\varphi, u}$  as defined by Equation (\*), where  $\varphi$  is some nonzero linear form defining  $H$  and  $u$  is some vector in  $H$ . We have  $\tau_{\varphi, u} = \text{id}$  iff  $u = 0$ .

**Definition 8.9.** Given any hyperplane  $H$  in  $E$ , for any nonzero linear form  $\varphi \in E^*$  defining  $H$  (which means that  $H = \text{Ker}(\varphi)$ ) and any nonzero vector  $u \in H$ , the linear map  $f = \tau_{\varphi, u}$  given by

$$\tau_{\varphi, u}(x) = x + \varphi(x)u, \quad \varphi(u) = 0,$$

for all  $x \in E$  is called a *transvection of hyperplane  $H$  and direction  $u$* . The map  $f = \tau_{\varphi, u}$  leaves every vector in  $H$  fixed, and  $f(x) - x \in Ku$  for all  $x \in E$ .

The above arguments show the following result.

**Proposition 8.22.** Let  $f: E \rightarrow E$  be a bijective linear map and assume that  $f \neq \text{id}$  and that  $f(x) = x$  for all  $x \in H$ , where  $H$  is some hyperplane in  $E$ . If there is some nonzero vector  $u \in E$  such that  $u \notin H$  and  $f(u) - u \in H$ , then  $f$  is a transvection of hyperplane  $H$ ; otherwise,  $f$  is a dilatation of hyperplane  $H$ .

*Proof.* Using the notation as above, for some  $v \notin H$ , we have  $f(v) = h + \alpha v$  with  $\alpha \neq 0$ , and write  $u = y + tv$  with  $y \in H$  and  $t \neq 0$  since  $u \notin H$ . If  $f(u) - u \in H$ , from

$$f(u) - u = t(h + (\alpha - 1)v),$$

we get  $(\alpha - 1)v \in H$ , and since  $v \notin H$ , we must have  $\alpha = 1$ , and we proved that  $f$  is a transvection. Otherwise,  $\alpha \neq 0, 1$ , and we proved that  $f$  is a dilatation.  $\square$

If  $E$  is finite-dimensional, then  $\alpha = \det(f)$ , so we also have the following result.

**Proposition 8.23.** Let  $f: E \rightarrow E$  be a bijective linear map of a finite-dimensional vector space  $E$  and assume that  $f \neq \text{id}$  and that  $f(x) = x$  for all  $x \in H$ , where  $H$  is some hyperplane in  $E$ . If  $\det(f) = 1$ , then  $f$  is a transvection of hyperplane  $H$ ; otherwise,  $f$  is a dilatation of hyperplane  $H$ .

Suppose that  $f$  is a dilatation of hyperplane  $H$  and direction  $u$ , and say  $\det(f) = \alpha \neq 0, 1$ . Pick a basis  $(u, e_2, \dots, e_n)$  of  $E$  where  $(e_2, \dots, e_n)$  is a basis of  $H$ . Then the matrix of  $f$  is of the form

$$\begin{pmatrix} \alpha & 0 & \cdots & 0 \\ 0 & 1 & & 0 \\ \vdots & & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{pmatrix},$$
