

Another important application of the SVD is *principal component analysis* (or *PCA*), an important tool in data analysis.

Yet another fruitful way of interpreting the resolution of the system $Ax = b$ is to view this problem as an intersection problem. Indeed, each of the equations

$$\begin{aligned}x_1 + 2x_2 - x_3 &= 1 \\2x_1 + x_2 + x_3 &= 2 \\x_1 - 2x_2 - 2x_3 &= 3\end{aligned}$$

defines a subset of \mathbb{R}^3 which is actually a *plane*. The first equation

$$x_1 + 2x_2 - x_3 = 1$$

defines the plane H_1 passing through the three points $(1, 0, 0)$, $(0, 1/2, 0)$, $(0, 0, -1)$, on the coordinate axes, the second equation

$$2x_1 + x_2 + x_3 = 2$$

defines the plane H_2 passing through the three points $(1, 0, 0)$, $(0, 2, 0)$, $(0, 0, 2)$, on the coordinate axes, and the third equation

$$x_1 - 2x_2 - 2x_3 = 3$$

defines the plane H_3 passing through the three points $(3, 0, 0)$, $(0, -3/2, 0)$, $(0, 0, -3/2)$, on the coordinate axes. See Figure 3.1.

Figure 3.1: The planes defined by the preceding linear equations.
