This time,  $1 - 10^{-4} = 0.9999$  and  $1 - 2 \times 10^{-4} = 0.9998$  are rounded off to 0.999 and the solution is x = 1, y = 1, much closer to the exact solution.

To remedy this problem, one may use the strategy of partial pivoting. This consists of choosing during Step k  $(1 \le k \le n-1)$  one of the entries  $a_{i,k}^{(k)}$  such that

$$|a_{i\,k}^{(k)}| = \max_{k \le p \le n} |a_{p\,k}^{(k)}|.$$

By maximizing the value of the pivot, we avoid dividing by undesirably small pivots.

**Remark:** A matrix, A, is called *strictly column diagonally dominant* iff

$$|a_{jj}| > \sum_{i=1, i \neq j}^{n} |a_{ij}|, \text{ for } j = 1, \dots, n$$

(resp. strictly row diagonally dominant iff

$$|a_{ii}| > \sum_{j=1, j \neq i}^{n} |a_{ij}|, \text{ for } i = 1, \dots, n.$$

For example, the matrix

$$\begin{pmatrix} \frac{7}{2} & 1 & & & \\ 1 & 4 & 1 & & 0 \\ & \ddots & \ddots & \ddots & \\ 0 & & 1 & 4 & 1 \\ & & & 1 & \frac{7}{2} \end{pmatrix}$$

of the curve interpolation problem discussed in Section 8.1 is strictly column (and row) diagonally dominant.

It has been known for a long time (before 1900, say by Hadamard) that if a matrix A is strictly column diagonally dominant (resp. strictly row diagonally dominant), then it is invertible. It can also be shown that if A is strictly column diagonally dominant, then Gaussian elimination with partial pivoting does not actually require pivoting (see Problem 8.12).

Another strategy, called *complete pivoting*, consists in choosing some entry  $a_{ij}^{(k)}$ , where  $k \leq i, j \leq n$ , such that

$$|a_{ij}^{(k)}| = \max_{k \le p, q \le n} |a_{pq}^{(k)}|.$$

However, in this method, if the chosen pivot is not in column k, it is also necessary to permute columns. This is achieved by multiplying on the right by a permutation matrix. However, complete pivoting tends to be too expensive in practice, and partial pivoting is the method of choice.

A special case where the LU-factorization is particularly efficient is the case of tridiagonal matrices, which we now consider.
