*Proof.* For all  $u, v \in E$  and all  $\mu \in \mathbb{C}$ , we have observed that

$$\varphi(u + \mu v, u + \mu v) = \varphi(u, u) + 2\Re(\overline{\mu}\varphi(u, v)) + |\mu|^2 \varphi(v, v).$$

Let  $\varphi(u,v) = \rho e^{i\theta}$ , where  $|\varphi(u,v)| = \rho$  ( $\rho \ge 0$ ). Let  $F: \mathbb{R} \to \mathbb{R}$  be the function defined such that

$$F(t) = \Phi(u + te^{i\theta}v),$$

for all  $t \in \mathbb{R}$ . The above shows that

$$F(t) = \varphi(u, u) + 2t|\varphi(u, v)| + t^2\varphi(v, v) = \Phi(u) + 2t|\varphi(u, v)| + t^2\Phi(v).$$

Since  $\varphi$  is assumed to be positive, we have  $F(t) \geq 0$  for all  $t \in \mathbb{R}$ . If  $\Phi(v) = 0$ , we must have  $\varphi(u, v) = 0$ , since otherwise, F(t) could be made negative by choosing t negative and small enough. If  $\Phi(v) > 0$ , in order for F(t) to be nonnegative, the equation

$$\Phi(u) + 2t|\varphi(u,v)| + t^2\Phi(v) = 0$$

must not have distinct real roots, which is equivalent to

$$|\varphi(u,v)|^2 \le \Phi(u)\Phi(v).$$

Taking the square root on both sides yields the Cauchy-Schwarz inequality.

For the second part of the claim, if  $\varphi$  is positive definite, we argue as follows. If u and v are linearly dependent, it is immediately verified that we get an equality. Conversely, if

$$|\varphi(u,v)|^2 = \Phi(u)\Phi(v),$$

then there are two cases. If  $\Phi(v) = 0$ , since  $\varphi$  is positive definite, we must have v = 0, so u and v are linearly dependent. Otherwise, the equation

$$\Phi(u) + 2t|\varphi(u,v)| + t^2\Phi(v) = 0$$

has a double root  $t_0$ , and thus

$$\Phi(u + t_0 e^{i\theta} v) = 0.$$

Since  $\varphi$  is positive definite, we must have

$$u + t_0 e^{i\theta} v = 0,$$

which shows that u and v are linearly dependent.

If we square the Minkowski inequality, we get

$$\Phi(u+v) \le \Phi(u) + \Phi(v) + 2\sqrt{\Phi(u)}\sqrt{\Phi(v)}.$$

However, we observed earlier that

$$\Phi(u+v) = \Phi(u) + \Phi(v) + 2\Re(\varphi(u,v)).$$
