Before defining the natural generalization of an inner product, it is convenient to define semilinear maps.

Definition 14.1. Given two vector spaces E and F over the complex field \mathbb{C} , a function $f: E \to F$ is semilinear if

$$f(u+v) = f(u) + f(v),$$

$$f(\lambda u) = \overline{\lambda}f(u),$$

for all $u, v \in E$ and all $\lambda \in \mathbb{C}$.

Remark: Instead of defining semilinear maps, we could have defined the vector space \overline{E} as the vector space with the same carrier set E whose addition is the same as that of E, but whose multiplication by a complex number is given by

$$(\lambda, u) \mapsto \overline{\lambda}u.$$

Then it is easy to check that a function $f: E \to \mathbb{C}$ is semilinear iff $f: \overline{E} \to \mathbb{C}$ is linear.

We can now define sesquilinear forms and Hermitian forms.

Definition 14.2. Given a complex vector space E, a function $\varphi \colon E \times E \to \mathbb{C}$ is a sesquilinear form if it is linear in its first argument and semilinear in its second argument, which means that

$$\varphi(u_1 + u_2, v) = \varphi(u_1, v) + \varphi(u_2, v),$$

$$\varphi(u, v_1 + v_2) = \varphi(u, v_1) + \varphi(u, v_2),$$

$$\varphi(\lambda u, v) = \lambda \varphi(u, v),$$

$$\varphi(u, \mu v) = \overline{\mu} \varphi(u, v),$$

for all $u, v, u_1, u_2, v_1, v_2 \in E$, and all $\lambda, \mu \in \mathbb{C}$. A function $\varphi \colon E \times E \to \mathbb{C}$ is a Hermitian form if it is sesquilinear and if

$$\varphi(v,u) = \overline{\varphi(u,v)}$$

for all all $u, v \in E$.

Obviously, $\varphi(0,v)=\varphi(u,0)=0$. Also note that if $\varphi\colon E\times E\to\mathbb{C}$ is sesquilinear, we have

$$\varphi(\lambda u + \mu v, \lambda u + \mu v) = |\lambda|^2 \varphi(u, u) + \lambda \overline{\mu} \varphi(u, v) + \overline{\lambda} \mu \varphi(v, u) + |\mu|^2 \varphi(v, v),$$

and if $\varphi \colon E \times E \to \mathbb{C}$ is Hermitian, we have

$$\varphi(\lambda u + \mu v, \lambda u + \mu v) = |\lambda|^2 \varphi(u, u) + 2\Re(\lambda \overline{\mu} \varphi(u, v)) + |\mu|^2 \varphi(v, v).$$

Note that restricted to real coefficients, a sesquilinear form is bilinear (we sometimes say \mathbb{R} -bilinear).
